THIS CASEBOOK contains a selection of 191 U. S. Court of Appeals decisions that analyze and discuss issues affecting the regulation of electric utilities and wholesale electricity markets. The selection of decisions spans from 2004 to the date of publication.

Under the Federal Power Act, the Federal Energy Regulatory Commission ("FERC") has jurisdiction over the "transmission of electric energy in interstate commerce," 16 U.S.C. § 824(b)(1), and is responsible for maintaining the reliability of the electric grid, see *id.* § 824o(b)(1). FERC has certified the North American Electric Reliability Corporation ("NERC") as the nation's "electric reliability organization," and NERC has developed enforceable standards to ensure electric grid reliability. See *Alcoa, Inc. v. FERC*, 564 F.3d 1342, 1344-45 (D.C. Cir. 2009). FERC regulates electricity grid managers known as Independent System Operators ("ISOs") or Regional Transmission Organizations ("RTOs") (collectively, "System Operators"), who are responsible for ensuring electric reliability within their regions of responsibility. See *Braintree Elec. Light Dep't v. FERC*, 550 F.3d 6, 8-9 (D.C. Cir. 2008) (describing history of RTOs). [Footnote omitted.] *Delaware Department of Natural Resources And Environmental Control v. Environmental Protection Agency*, (DC Cir. 2015).

These System Operators are usually involved in both the energy and capacity markets. Energy "is the amount of electricity generators actually provide to the grid and is available to be used at any moment. Organized wholesale electricity markets buy and supply electricity instantaneously." Kennedy Maize, Texas and the Capacity Market Debate, *Power Mag.*, Feb. 1, 2014. [Footnote omitted.] *Delaware Department of Natural Resources And Environmental Control v. Environmental Protection Agency*, *ibid.*

Capacity is different. "Capacity' is not electricity itself but the ability to produce it when necessary. It amounts to a kind of call option that electricity transmitters purchase from parties generally, generators who can either produce more or consume less when required." Conn. Dep't of Pub. Util. Control v. FERC, 569 F.3d 477, 479 (D.C. Cir. 2009); see also Me. Pub. Util. Comm'n v. FERC, 520 F.3d 464, 467 (D.C. Cir. 2008) (per curiam), rev'd in part sub nom. NRG Power Mktg., LLC v. Me. Pub. Util. Comm'n, 558 U.S. 165 (2010). These sales may occur years in advance of when the capacity is actually needed; power generators are thus able to plan and build facilities to meet future demand. See Md. Pub. Serv. Comm'n v. FERC, 632 F.3d 1283, 1284-85 (D.C. Cir. 2011) (per curiam). Delaware Department of Natural Resources And Environmental Control v. Environmental Protection Agency, *ibid.*

ISOs and RTOs typically require local utilities delivering electricity to users (known as "load-serving entities," or LSEs) to purchase a certain amount of capacity to ensure reliability during periods of high demand. See, e.g., Elec. Consumers Res. Council v. FERC, 407 F.3d 1232, 1234 (D.C. Cir. 2005). "The goal is for [utilities] to purchase sufficient capacity to easily meet expected peaks in electricity demand on their transmission systems." Conn. Dep't of Pub. Util. Control, 569 F.3d at 479. Delaware Department of Natural Resources And Environmental Control v. Environmental Protection Agency, *ibid.*
